No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                             /SIDS2/gcddata/geneseqn.embl/NA1980.DAT:*

arabitol, ribitol which confer selective advantage on transformed FF X 8 X 000 000 000 000 X 8

Claim 1; Page 34-35; 37pp; English.

used in positively selecting transgenic cells from a population of cells unique the positive selection method, the presence of the gene of interest in the genetically transformed cells may be determined without the disadvantages associated with traditional negative selection systems. Positive selection of the transformed cells is achieved without transformed cells may be identified by simple visual means without transformed cells may be identified by simple visual means without the use of a separate assay to determine the presence of a marker gene. This technique also avoids the release of antibiotics or other dangerous genes into the environment. The present sequence is Escherichia coli The present invention relates to a positive selection system that involves conferring to transferred cells the ability to metabolise arabitol, ribitol and/or mannitol. The positive selection method is strain C arabitol dehydrogenase gene.

Gluconobacter oxydans derived D-sorbitol dehydrogenase obtainable by culturing its gene-transformed host cells, useful for producing L-sorbose or 2-keto-L-gluconic acid as an intermediate in L-ascorbic acid production

9; Page 60-63; 72pp; Japanese. Claim

The invention relates to Gluconobacter oxydans D'sorbitol dehydrogenase (SLDH; AAB33172) and to the gene encoding it (AAA97430). SLDH has a molecular weight of about 54 kba and catalyses the conversion of D-sorbitol into L-sorbose using NADP+ as a co-enzyme. SLDH specifically catalyses the oxidation of sorbitol, mannitol and arabitol, but does not encompasses expression vectors and host cells comprising the close concompasses expression vectors and host cells comprising the Gluconobacter oxydans SLDH gene, and the recombinant production of SLDH. contacting the recombinant SLDH with D-sorbitol; a process for producing 2-keto-L-gluconic acid by contacting recombinantly produced sorbose dehydrogenase and/or sorbosone dehydrogenase with L-sorbose; and a process for preparing L-ascorbic acid or its alkaline earth metals salts by conversion from 2-keto-L-gluconic acid. SLDH is useful for producing L-sorbose or 2-keto-L-gluconic acid. SLDH is useful for producing L-sorbose or 2-keto-L-gluconic acid as an intermediate in L-ascorbic the Gluconobacter production. The present sequence represents SLDH gene.

The present sequence encodes Gluconobacter suboxydans L-sorbose reductase.

N.B. This patent is equivalent to the basic NO9901197 in week 199949.
                                                                                                            Gluconobacter suboxydans; L-sorbose reductase; genetic engineering;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                725 AGCTCAACGAAGCCAGTGGCCTGCACGACGACCTGCCGCTGCAGAAGACTTTCATC

AAZ32000 and AAZ32001 encode, and AAY49501 and AAY49502 represent, human metalloprotease thrombospondin (METH) proteins METH1 and METH2 respectively. METH1 and METH2 have been found to be potent inhibitors of anglogenesis both in vitro and in vivo. They can be used for treating cancer and other disorders related to anglogenesis including abnormal wound healing, inflammation, rheumatoid arthritis, psoriasis,

                macula degeneration, haemangiomas, and arterial venous mainformations. They may be useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilisation (chemotaxis) of immune cells. The etiology of these cancer cancers or disorders may be genetic, somatic, such as cancer or some autoimmune disorders, acquired (e.g. by chemotherapy or toxins), or infectious. They can also be used to treat inflammatory used for detection and diagnosis. AA322002 to AA322009, and AA445503 to AA445511 represent sequences given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1213
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  7459

The present sequence is an expressed sequence tag (EST) for METH. METH can be used for inhibiting angiogenesis in an individual, and for treating cancer, benign tumours, an ocular angiogenic disease, rheumatoid arthritis, psoriasis, delayed wound healing, endometriosis, vasculogenesis, granulations, hypertrophic scars, nonunion fractures, scleroderma, trachoma, vascular adhesions, myocardial anglogenesis,
